LIMS-plus Release Notes 5.3.34

TFS No.	Description	Solution Description	Known Limitations
46459	The AddedByStaffId column will be retained in the Test DUI table in the database when a Test template is deleted from within the DUI Designer interface.	In the event a Test DUI is created and then deleted in the DUI Designer interface (instead of Admin | User Interface | Test), LIMS-plus now retains the AddedByStaffId column in the Test DUI table in the database. Retaining this column eliminates errors from occurring when users interact with an existing request for a service that uses the Test DUI.	
47440	The Edit Request menu option has been updated to View Request for pending and cancelled requests in the Request tab.	When a request is pending or cancelled, it is not able to be assigned or otherwise edited. The Edit Request menu option has been replaced with a View Request menu option for requests in pending or cancelled statuses.	
49913	The UserId column of the Audit table in the database records the correct value when a result is deleted from a request.	When a result is added by one user and deleted by a different user, the User ID of the person who performed the delete action will be recorded in the Audit table.	
49953	Content is saved appropriately in rich text boxes when using the Edge browser.	The rich text editor saves content (and closes if Save and Close is clicked), when using the Edge browser.	*We discovered after the release that the Subject line of email notification administration is not saving changes when used in the Edge browser. It will be fixed in a future release; however, users are able to use IE11 to modify the Subject field.*
50293	A message has been added to LIMS-plus to alert users changing the analytical module on a service, that any existing batches using that service can no longer be edited.	In the Edit Service window, when users change the current selection in the Analytical Module drop down, an alert message will populate informing users that any existing batches using this service can no longer be edited.	*This reminder occurs regardless of whether the service appears in a batch, just to notify the administrator to check sample batches first.*

JusticeTrax

TFS No.	Description	Solution Description	Known Limitations
50296	Case attachments reopen successfully when using FileSystem as the Document Store Location Type.	When a case attachment is opened with the DocuVieware Viewer, the attachment remains untouched on the file system when the viewer is closed by clicking Cancel or the X in the upper right-hand corner to close the viewer. This allows for the attachment to be reopened.	
50804	Migrated case-sensitive barcodes are supported in LIMS-plus.	Barcode IDs are considered unique by the application and return the appropriate evidence item even if an ID with all uppercase letters of the same makeup is already stored against a different evidence item (e.g. AbCdEf and ABCDEF and Abcdef are all considered unique IDs by the application). These IDs are stored in a new column in the database.	*Only applicable for existing barcodes that are migrated into the database.*
51216	Content is saved appropriately in a sample result DUI that contains only a rich text box control when using the Edge browser.	When a sample batch result DUI utilizes only a rich text box, the rich text editor saves content successfully when using the Edge browser.	
51366	The Request Status is reverted back to Started when unassigned requests are set to Pending or Cancelled status and then Un-Pended or Un-Cancelled.	In the Request tab of the Main Case View, an unassigned request that is Pending or Cancelled and then Un-Pended or Un-Cancelled will be set back to the Request Status of Started, instead of In Progress.	
51392	Order and Numeric Input values are updated accordingly when samples are removed from a sample batch.	When a sample batch contains samples from multiple requests and one of those requests is deleted, the sample Order and Numeric Input now reflect the correct sample numbers within the sample batch results entry interface.	

TFS No.	Description	Solution Description	Known Limitations
51461	The Reviewed flag is properly retained for samples that have been reviewed, but do not have a result, on deletion of another sample's result.	Samples in a batch that have been reviewed but do not have a result will retain their reviewed checkmark when a different sample's result has been deleted.	
51464	The Finish button within sample batch results entry is only enabled when all samples in a batch have been reviewed.	In sample batch when a result is deleted and a user returns to the same sample, the Finish button is only enabled if all samples have been previously reviewed.	
51468	Results within a Test DUI containing radio buttons are properly retained when a new row is added to the Test.	When sample batch results are entered for a service utilizing a Test DUI that contains radio buttons, and the Add button is clicked to add an additional row to the Test, the results entered into the previous rows of the Test are retained as entered.	*May need to clear browser cache in order to see this change.*
51516	Sample result Test DUIs that contain a DateTimePicker control no longer cause a server error.	Sample result Test DUIs that contain a DateTimePicker control can now be processed successfully without encountering a server error.	
51583	Sample batches that are inactive can no longer be processed.	In the main sample batch grid, the Process Batch button is no longer visible for batches that are inactive. In addition, users will not be prompted, "Do you want to process the batch now?" following edits made to an inactive batch.	
51588	Rich text box and DateTimePicker sample results are retained appropriately when navigating through samples in a batch using the numeric input field.	When an existing sample result is left unchanged and the user navigates to a different sample in the batch by highlighting the sample number in the numeric input, changing the number, and pressing the Enter key, all results are retained and the user is directed to the sample of their choice.	

TFS No.	Description	Solution Description	Known Limitations
51805	LIMS-plus responds with the designated Required Validator Message when navigating away from a sample in a batch that contains an unsatisfied required field in the sample result DUI.	The application does not hang when users attempt to navigate to another sample without satisfying required fields within a sample result DUI. The required field validation message populates, allowing users to satisfy required fields and successfully navigate to a different sample.	
51832	Results within additional rows added to a Test DUI can be unique when navigating through samples using the Next button in the sample batch results entry interface.	Results in additional rows of Test DUIs are not copied from one sample to another when navigating through samples within a batch using the Next button.	
51833	Test DUI results contained in a sample batch are not visible in the Main Case View Request tab until the batch is finished.	Test DUI results within an unfinished batch are not visible in the Main Case View Request tab. Sample batch results are only visible in the request when the batch is finished.	
51886	Deleting results in a Test DUI using the red X icon to the right of the Test row is auto-saved when the Close button is clicked in the sample batch results entry interface.	When Test DUI rows containing sample results are deleted with the red X icon and the Close button is clicked to auto-save changes made to the sample, results are removed from the deleted Test DUI rows permanently. When users navigate back to the sample, the default number of Test DUI rows are displayed as configured during the Test DUI creation.
